Written code-switching in the Greek-Cypriot speech community
Pavlos Pavlou

This is an attempt to describe written code switching in the Greek-Cypriot speech community. The codes that seem to figure prominently in written code switching are, primarily, Standard Modern Greek (in its synchronic and diachronic variation) and English. The Cypriot Dialect and other languages appear less often in the written code and therefore they are seldom observed in code switching.

Another aim of the study is to discover similarities and differences among written and oral code switching. In some cases it seems that written code-switching is simply the written version of oral code-switching. In most cases written code switching fulfills functions similar to ones fulfilled by oral code switching such as expressing expertise, knowledge and ability. Moreover, we observe cases in which the code switching is dictated by the linguistic system and cases in which the code-switching is driven by sociolinguistic reasons and functions as an act of identity. Finally an attempt is made to explain code switching with regard to the speech act that is accomplished by the utterance containing instances of code switching.
